# AutoCarControl 앱 생성

Create New Project

## Create Android Project

**Application name**  
AutoCarControl

**Company domain**  
modulab.example.com

**Project location**  
D:\tmp\Wrl4nw\AutoCarControl

**Package name**  
com.example.modulab.autocarcontrol

☐ Include C++ support  
☐ Include Kotlin support

Previous Next Cancel Finish

Create New Project

## Target Android Devices

**Select the form factors and minimum SDK**  
Some devices require additional SDKs. Low API levels target more devices, but offer fewer API features.

☒ **Phone and Tablet**  
API 22: Android 5.1 (Lollipop)  
By targeting **API 22 and later**, your app will run on approximately **80.2%** of devices. [Help me choose](#)  
☐ Include Android Instant App support

☐ **Wear OS**  
API 23: Android 6.0 (Marshmallow)

☐ **TV**  
API 21: Android 5.0 (Lollipop)

☐ **Android Auto**  
☐ **Android Things**  
API 24: Android 7.0 (Nougat)

Text: "Disconnect"

# WiFi 소스- onClickControl 추가

MainActivity 클래스에서 아래와 같이 변수 및 Thread, 버튼 동작 함수를 추가한다.

```
public class MainActivity extends AppCompatActivity {
```

```
//code is added -->
```

```
private int task_state = 0;
```

```
TextView mMainText;
```

```
EditText mNumEdit1;
```

```
TcpThread mThread;
```

```
//code is added <--
```

```
protected void onCreate(Bundle savedInstanceState) {
```

```
    super.onCreate(savedInstanceState);
```

```
    setContentView(R.layout.activity_main);
```

```
//code is added -->
```

```
mMainText = (TextView)findViewById(R.id.connectText);
```

```
mNumEdit1 = (EditText)findViewById(R.id.ipAddress);
```

```
mThread = new TcpThread(mHandler);
```

```
mThread.setDaemon(true);
```

```
mThread.start();
```

```
//code is added <--
```

```
}
```

```
//code is added -->
```

```
public void onClickControl(View v) {
```

```
    Message msg;
```

```
    switch (v.getId()) {
```

```
        case R.id.bConnect:
```

```
            if(task_state == 1) break;
```

```
            String addr = mNumEdit1.getText().toString();
```

```
            msg = new Message();
```

```
            msg.what = 0;
```

```
            msg.obj = (String)addr;
```

```
            mThread.mBackHandler.sendMessage(msg);
```

```
            break;
```

```
        case R.id.bDisconnect:
```

```
            if(task_state == 0) break;
```

```
            msg = new Message();
```

```
            msg.what = 7;
```

```
            msg.obj = (String)mNumEdit1.getText().toString();
```

```
            mThread.mBackHandler.sendMessage(msg);
```

```
            break;
```

```
    }
```

```
}
```

```
//code is added <--
```

# WiFi 소스- 핸들러 추가

MainActivity 클래스에서 아래와 같이 핸들러 함수를 추가한다.

```
public class MainActivity extends AppCompatActivity {
```

```
//code is added -->
```

```
    Handler mHandler = new Handler() {  
        public void handleMessage(Message msg) {  
            switch (msg.what) {  
                case 0:  
                    if(msg.arg1 == 0) {  
                        mMainText.setText("connection successful : " + msg.obj);  
                        task_state = 1;  
                    }else if(msg.arg1 == 1)  
                    {  
                        mMainText.setText("connection fail : " + msg.obj);  
                        task_state = 0;  
                    }  
                    break;  
  
                case 7:  
                    mMainText.setText("disconnect : ");  
                    task_state = 0;  
                    break;  
  
                default:  
                    break;  
            }  
        }  
    };  
};
```

```
//code is added <--
```

# WiFi 소스 - TcpThread 추가

MainActivity.java 파일에 TcpThread 클래스를 추가한다.

connect 인 경우 코드

```
try {
    Thread.sleep(200);
} catch (InterruptedException e) {
    ;
}
if (start == 0) {
    try {
        sock = new Socket((String) msg.obj, 1234);
        outs = sock.getOutputStream();
        start = 1;

        retmsg.what = 0;
        retmsg.arg1 = 0;          // success
        retmsg.obj = (String) msg.obj;
    } catch (Exception ex) {
        ex.printStackTrace();
    }

    start = 0;
    retmsg.what = 0;
    retmsg.arg1 = 1;          // fail
    retmsg.obj = (String) msg.obj;
}
}
```

```
class TcpThread extends Thread {
    Handler mMainHandler;
    Handler mBackHandler;
    private Socket sock;
    private OutputStream outs;
    private int start = 0;

    TcpThread(Handler handler) {
        mMainHandler = handler;
    }

    public void run() {
        Looper.prepare(); // 작업스레드를 위한 looper 준비
        mBackHandler = new Handler() {
            public void handleMessage(Message msg) {
                Message retmsg = new Message();

                switch (msg.what) {
                    case 0: // connect
                        break;

                    case 7: // disconnect
                        break;

                    default:
                        break;
                }
                mMainHandler.sendMessage(retmsg); //
            }
        };
        Looper.loop(); // }
    }
}
```

disconnect 인 경우 코드

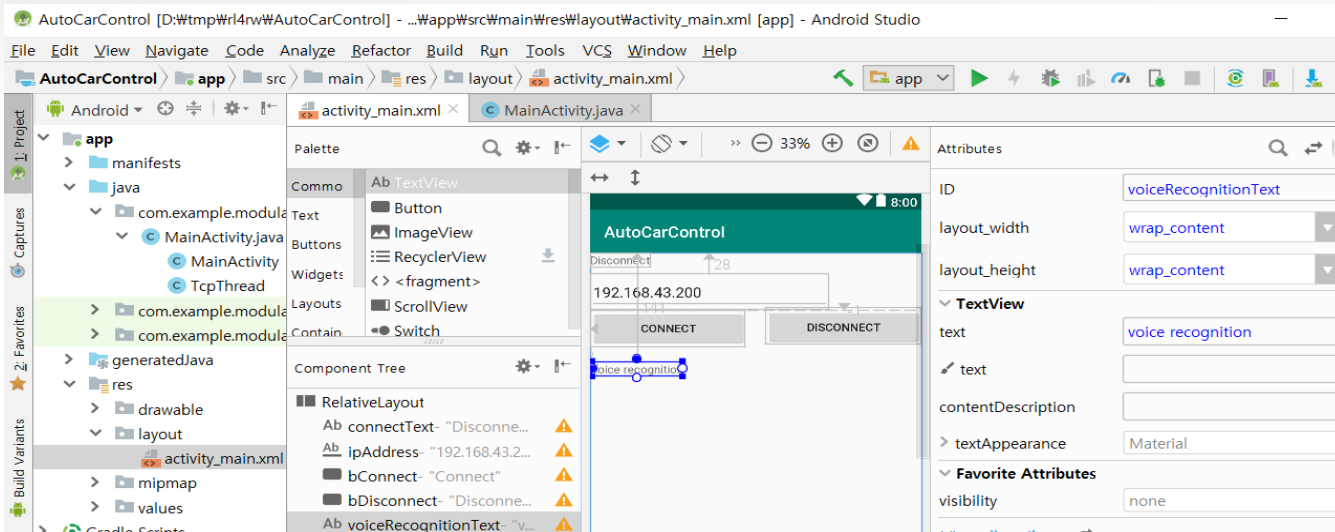

```
try {
    Thread.sleep(200);
} catch (InterruptedException e) {
    ;
}
if (start == 1) {
    try {
    } catch (Exception ex) {
        ex.printStackTrace();
    }

    try {
        sock.close();
        sock = null;
    } catch (IOException e) {
        e.printStackTrace();
    }

    start = 0;
    retmsg.what = 7;
}
}
```

# 음성인식 GUI 구성

음성인식 GUI 를 추가한다.

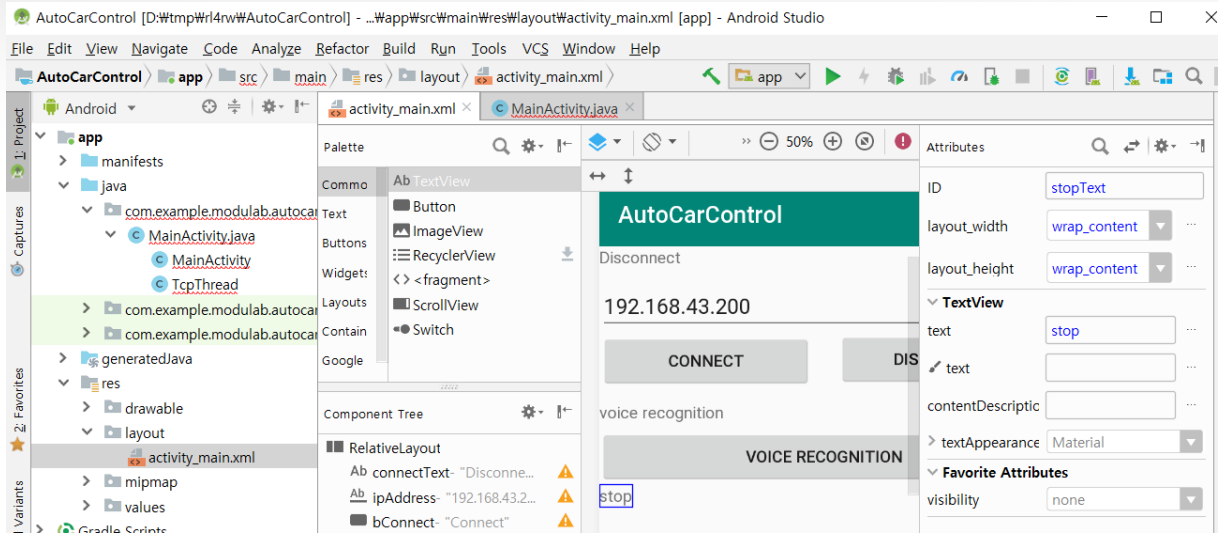

TextView 추가하기  
ID: "voiceRecognitionText"  
Text: "voice recognition"

버튼 추가하기  
ID: "bVoiceRecognition"  
onClick: "onClickControl"  
Text: "Voice Recognition"

# 음성인식 GUI 구성

# 음성인식 -onClickListener 수정

```
